Since Nexis Uni contains billions of news articles - finding exactly what you want requires some special commands.

Many of the articles stored in Nexis Uni are simply brief announcements and not useful for your research.

Fortunately, you can ask Nexis Uni to find articles that are longer. To do this, you tell LexisNexis the minimum number of words you want to see.

For instance, you can tell Nexis Uni that you only want to see articles that are at least 1000 words in length by applying the command ...

length>1000

A nice rule of thumb is that an article of at least 1000 words will actually give you something with a bit of depth and sufficient content.
